Nappes and overthrusts are the most representative geological structures in mountain chains. The issue of their emplacement mechanisms and of the driving force of these displacements is a major problem in tectonics which interests, for near to a century now and not without harsh controversies, a significant proportion of structural geologists and geoscientists who work in the field of rock mechanics. This book attempts to give a clear and didactic synthesis of the current knowledge of the concept of thrusting, principally by tackling two approaches, mechanics and kinematics, which have

proposed some solutions to this problem. At first (Chapter 1), the notions of thrusting are defined, with the most recent terminology and the most important geometric aspects. This introduction to the geometry of thrusts is logically followed by the presentation of their problem; the issue of the emplacement mechanisms (Chapter 2). Let us note in passing that the formulation of the concept and the presentation of its problem are associated historically, which justifies presenting them in the historical framework of this discovery before tackling the different solutions and mechanical hypotheses. These are detailed in Chapter 3 by following a chronological progression, and emphasising the divergences and oppositions between different models so as to cover them fully. The chapter on the kinematics (Chapter 4) then returns to the type of data which can be collected in the field, by clarifying the relationships between displacement and internal strain.

This book aims to help beginners play the trombone. Like all brass instruments, the trombone changes pitch when the physical length of the tubing the air passes through changes. The trombone has a special extendable slide that functions as the valves do on other brass instruments. The trombone changes length when the player extends the main slide. When the slide gets longer, the pitch goes lower. The book includes 32 trombone diagrams with fingering positions, along with pitch names and staff notations. Each note here has its own page in the book. The musical notes in this book cover almost 3 octaves from E2 to B4. The trombone 's slide has seven positions:

the 1st position is when the slide is pulled closest to you and the 7th is when it is fully extended. However, the slide has no markers indicating these positions. On each page, the slide position in red corresponds to the particular note depicted. When there are two red numbers for the same note, it means that there are two variations for the slide position to create that note.
