Problems in Mechanical Technology covers the subject of mechanical technology in the first year of the Higher National Certificate Course in Engineering. It contains 13 chapters that deal with topics such as stress and strain; shearing forces and bending moments;

combined bending and direct stress; deflection of beams due to bending; strain energy; and relative velocity. Also discussed are the dynamics of a rigid body; free vibrations; flow of liquids; and thermodynamic systems. A wide selection of fully-worked examples is provided along with unworked problems with answers through which the student may work in his own time. Although intended for Higher National Certificate students, the book will also be of value in the early years of a Higher National Diploma Course and for those studying for the Part I Examination of the Council of Engineering Institutions. Equally it will be suitable for the new Higher Certificate and Higher Diploma courses to be introduced by the Technical Education Council. Designed for the core course on Workshop Practice offered to all first-year diploma and degree level students of engineering, this book presents clear and concise explanation of the basic principles of manufacturing processes and equips students with overall knowledge of engineering materials, tools and equipment commonly used in the engineering field. The book describes the general principles of different workshop processes such as primary and secondary shaping processes, metal joining methods, surface finishing and heat treatment. The workshop processes covered also include the hand-working processes such as benchwork, fitting, arc welding, sheet metal work, carpentry, blacksmithy and foundry. It also explains the importance of safety measures to be followed in workshop processes and details the procedure of writing the records of the practices. The tools and equipment used in each hand-working process are enumerated before elaborating the process. Finally, the book discusses the machining processes such as turning operations, the cutting tools and the tools used for measuring and marking, and explains the working principle of Engine Lathe. An appendix for advanced level practice and assessment of work has also been included. Diploma Thesis from the year 1999 in the subject Engineering - Mechanical Engineering, grade: 1, Massachusetts Institute of Technology, language: English, abstract: The following thesis elucidates the impact of the product design and the product development process on the design of a manufacturing system. In contrast to integrate constraints and restrictions of the manufacturing system and its processes into the initial design of a product , attributes and characteristics of the product design are analyzed by the way they influence and restrict the design of a manufacturing system. The upcoming hypothesis of this thesis claims latter approach to be the natural and logical one. A sophisticated design theory known as Axiomatic Design [Suh 1990] is used to embed the design of a manufacturing system into the design of the product and the product development system. The generic derivation of such an integrated design framework will allow a broad application to manufacturing and product development system design. The following paragraph outlines the background and the issues related to the motivation for this thesis. In the next step, the thesis objectives and hypothesis are stated, marking the scope and content of this academic discussion. Finally, a brief overview is provided about the content and structure of each chapter.
